In this section, we will need to create the different command line menus, so the user can interact with the application from command line. Menus will be displayed to the user from the console with different numbered options. Next, we will be using the `Scanner class` to read in the user's responses.

Here are the main steps you'll need to complete to create the menu classes:

Creating the MainMenu

First, you'll need to create the **MainMenu class**. The MainMenu should have the following menu items:

- [ ] `1. Find and reserve a room`
- [ ] `2. See my reservations`
- [ ] `3. Create an account`
- [ ] `4. Admin` (open the admin menu described below)
- [ ] `5. Exit` (exit the application)

Creating the AdminMenu

Next you'll need to create the **AdminMenu class**. The AdminMenu should have the following menu items:

- [ ] `1. See all Customers`
- [ ] `2. See all Rooms`
- [ ] `3. See all Reservations`
- [ ] `4. Add a Room`
- [ ] `5. Back to Main Menu` (returns back to the MainMenu)
